

Reo.Dev Copilot Prompt Analysis

To understand Copilot usage patterns and performance, I structured the analysis around Four key dimensions:

Job role of user - Analysis & Intent, Account Qualification, Content Creation, Research & Discovery, Refinement/Editing, Other

Complexity Score of the question - Simple , Medium, Complex

Questions tagged into - Account Research, Account Research & Qualification, Sales Outreach, Developer/Tech Focus, Other.

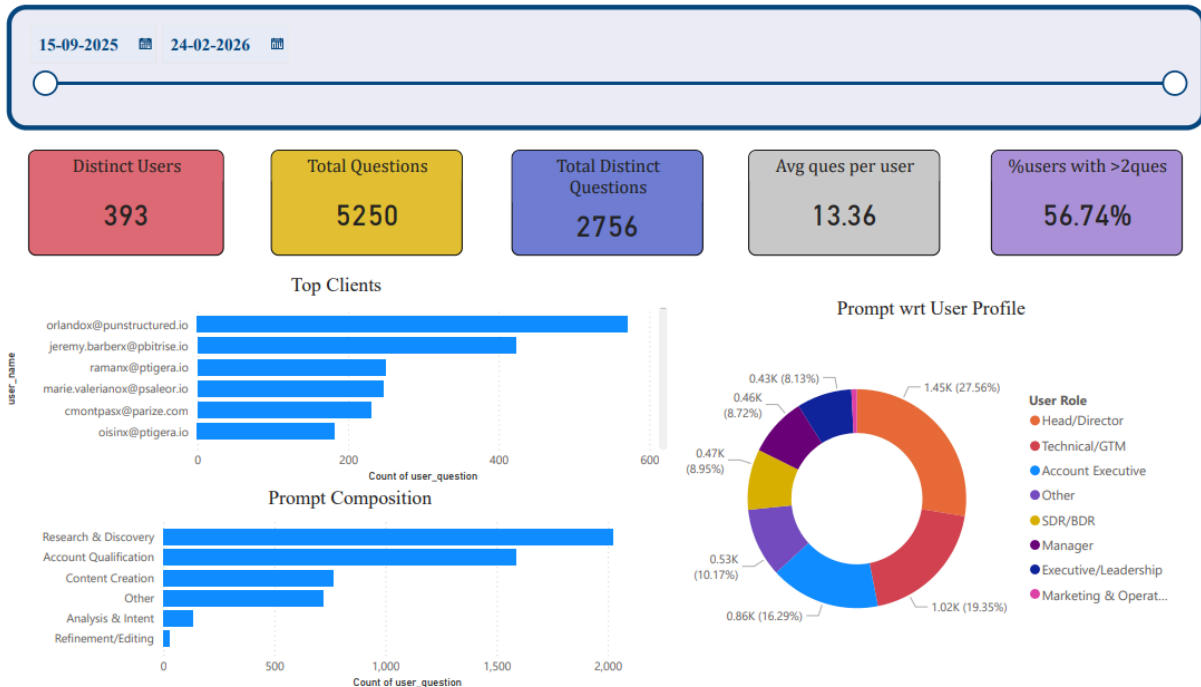

Company Domain - Tailored wrt to emails of the users.

These dimensions were selected to capture how users interact with the system, the level of effort required to generate responses, and the business context in which the tool is being used.

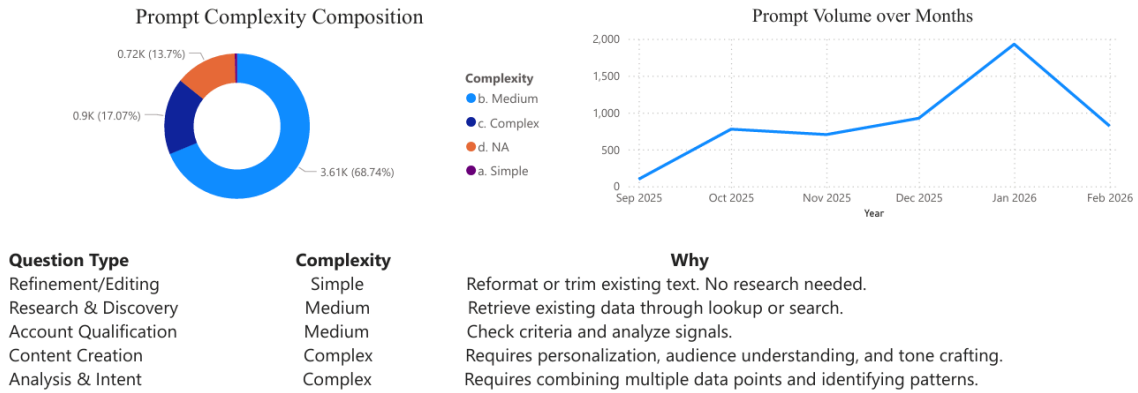

By analyzing usage across these categories, I was able to:

- Identify adoption and engagement trends
- Understand the types of tasks users rely on Copilot for
- Measure the complexity and quality of interactions
- Segment usage by role and organization
- Derive actionable insights to improve product adoption and performance

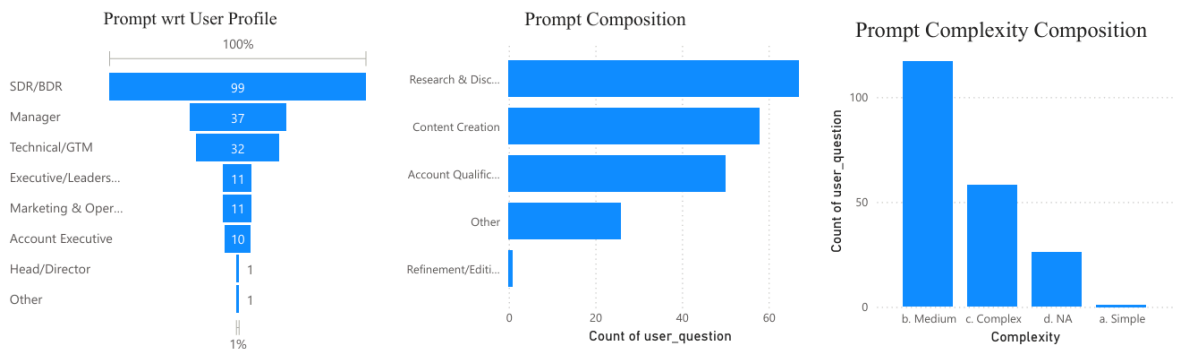

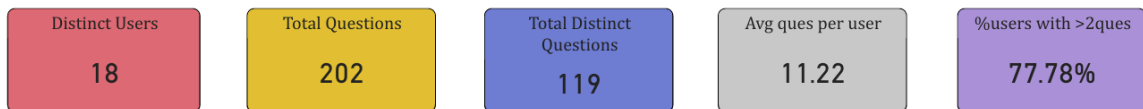

Prompt_analytics_Tanisha_reo.pdf

- **Adoption is strong**, with **393 users** generating **5,250 questions** and an average of **13.36 questions per user**, indicating consistent engagement with the chatbot.
- **Most usage is task-oriented**, with the highest volume coming from **Research & Discovery** and **Account Qualification**, showing the chatbot supports core business workflows.
- **Leadership and technical roles drive adoption**, with **Head/Director** and **Technical/GTM** users contributing the largest share of prompts, reflecting organizational trust in the tool.

Company Domain
paerospike.com

- **This dashboard provides a client-level view of chatbot adoption**, showing how a specific company engages with the product in terms of users, question volume, and repeat usage.

- **For this client, engagement is healthy**, with **18 users generating 202 questions** and **77.78% repeat usage**, indicating the tool is actively used within the account.
- **Usage is concentrated in operational roles and medium-complexity tasks**, highlighting how the chatbot supports day-to-day workflows for this particular client.

Key Insights from the Dashboard

Adoption is strong and sticky – 5250, total questions, 393 users, 56.7% of users ask >2 questions → the tool is part of the workflow.

High-value usage is nearly half – 47% of questions are directly tied to revenue tasks (Account Qualification, Content Creation, Analysis & Intent).

Quality of prompts are excellent – only 0.5% of questions are refinements; users rarely need to edit the output.

Leadership leads the way – Heads/Directors account for the most questions (1,447)

Scope of Improvement

Analysis & Intent is under-utilised – only 2.5% of questions. This is a missed opportunity for deeper strategic support.

Complexity is substantial – 79.6% medium, 19.8% complex. Users are not asking trivial questions; they trust the tool for significant tasks but for not very complex analysis.

New Metric to Add

Introduce a User Usage Time metric by leveraging **API logs** to measure how **long users actively interact** with the product.

Track session duration using **API request timestamps** to better understand engagement depth and product stickiness.

Use API call frequency and duration to identify power users, low-engagement users, and potential drop-off points.

Recommendations

Add a **thumbs up / thumbs down feedback** prompt to capture quick user sentiment after crossing a specific threshold of inactivity which can be computed via API logs.

Provide guided **prompt suggestions** to increase usage of strategic workflows (e.g., Analysis & Intent) as they have **repetitive** keywords that can streamline the search engine.

Adding a **recommendation system** to the search engine after choosing a specific category(pulled in accordance to the questions related to that company domain), **team-wise** recommendations within the search engine can further optimise user experience.
